Final Project

Between 2 or 3 people, choose 1 of the following to create
- A shared service
- IM messaging service for Business

Your product at the end should include the following:
- A user profile module
- A item description module
- A communication module
- Any other necessary or extra feature

User Profile Module
- Admin
  - User profile edit
- Client
  - User registration/login
  - Other user profile view
  - Other user item descriptions

Item Description Module
- Admin
  - Item Creation
  - My item view
  - Item Description Edit
  - Item Remove
  - Item Favorite
- Client
  - All item view
  - Single item view
  - Search Item

Communication Module
- Admin
  - Create new communication
  - View My communications
  - Edit my communication
  - Remove communication
  - Save communication
- Client
  - View other communication

Other Features
- TONS if you actually focus

Must use ajax for views and relationship data (likes, favourites, update etc.)
Must use a database with relationship table

50% if all 3 modules have a functional admin CRUD with simple theme styled interface
70% if all 3 modules have both Client and Admin features finished
70-100% depends on other features like item favourite, save, and extra features on your own. (If you can't think of any, you can always ask me after you are finished with your CRUD)

Difference between Final Assignment and project

- Your assignment will be a simple image description commenting application, which is the foundation of the barebones to the project.
- You create all the modules on your own for the assignment while for the project you focus on creating one module and advancing that module while your partner(s) do the same. At the end you combine the modules to make this really good application.
